1: Holmberg--8 (1941-42) 1950 Siriono
116, 141

"Because of the lack of accurate instruments while I was in the field, I was unable to record exact physical measurements of the Siriono. Roughly speaking, however, it can be said that the men average about 5 feet 4 inches in height; the women, about 5 feet 2 inches. The cephalic index falls within the range of brachycephaly to mesocephaly; the nasal index is definitely platyrrhine."
